SGSA impulse test systems can be used to generate impulse voltages simulating lightning strokes and switching surges. The total charging voltage ranges from 100 kV to 1’000 kV with a per-stage energy of 5 kJ. The system has all our experience acquired, in building Impulse Generators since 1932, behind it.

Applications covered include testing according to IEC, ANSI/IEEE as well as other national standards.

A number of optional additional circuits and components can be included to optimise the impulse test system for tests on:

- Power transformers
- Instrument transformers
- Cables (type tests)
- Arresters (impulse current tests)
- Insulators
- Bushings
- GIS and air-insulated breakers

in the factory or on-site. For the latter tests, the SGSA system can be mounted on a trailer.
BENEFITS

Quality
The electronic measurement and control components are designed and manufactured in-house in an ISO 9001 certified factory. Our many years of experience in dealing with electromagnetic compatibility of electronic devices in high voltage test bays provide the requisite expertise and a trouble-free operation and a long service life are thereby ensured.

Safety of Operation
The grounding device with two grounding strips and two grounding switches guarantees safe operation. The controls provide clear alarm messages and guide the user through the operations.

Grounding system
The integrated earthing system consists of two earthing switches which discharge the impulse capacitors via earthing resistors. Additionally motorised earthing strips create a short circuit across all capacitors and ground all stages.

Protection of Test Objects and Test Systems
The test system is shut down in case of over-voltage, over-current or fast voltage transients.

Extension Possibility
The impulse generator can be used for generation of other wave shapes (by adding resistors and or other external circuits). Load range can also be extended by adding external Glaninger circuit or an external Overshoot Compensation device.

Ease of Operation with Modern Control System
The generator controls are very comfortable and flexible, safety features are implemented in the hardware too, independent of software. All components of the control system are EMC tested.

Main features of the SGS system are:
- Sleek and flexible design
- Total charging voltage from 100 kV up to 1'000 kV.
- Energy per stage 5 kJ.
- Computerized and microprocessor based control system.
- Equipped with resistors for lightning voltages and resistors for switching impulse voltages are available optionally.
- Unique protective grounding device.
- Ingenious extensions of load range (Glaninger Circuit, Overshoot Compensation, Special Resistor sets for transformer, cable or GIS testing).
- Short reconfiguration times by utilizing handy plug-in resistors and connections.
- Series resistors can be interchanged with one another as can be the parallel resistors. Different values of a resistor type can be supplied.
- Spark gaps can be encapsulated optionally.
- Base frames with very small foot print.
- Liquid insulation in the impulse capacitors is made of castor oil (no PCB’s) making sense ecologically.
- Feedback loop between measuring system and control allows the determination of the efficiency and to work with test voltages instead of charging voltages

Immunity to Electromagnetic Interference
The SGSA test system is designed especially for minimizing the influence of interference fields to ensure correct functioning of the controls and measuring instruments. The measurement signal from the high voltage divider is in the range of 100 V to 1’600 V in order to ensure a high signal to noise ratio.
THEORY
SGS generators are based on MARX multiplier circuits. The impulse test system operates under a control system which charges the impulse generator through the charging unit. This is achieved as the stages in the impulse generator are connected in parallel via the charging resistors. Charging time and charging voltage can be selected by the operator.

Once the selected charging voltage has been reached, a trigger pulse initiates firing of the first spark-gap of the impulse generator. The resulting over-voltage triggers the successive stages. As all the spark-gaps fire, the stages which are in series now, multiply the charging voltage to reach the test voltage.

An impulse voltage divider reduces the impulse voltage to a value that the measuring and recording instruments can use.

The major impulse circuit elements such as capacitors and resistors are arranged in an optimum manner to simultaneously satisfy the two major requirements viz. smallest possible internal inductance and operating convenience.

OPERATING RANGE
The minimum output voltage is 10 kV positive and negative. This is obtained with only one stage operating. The other stages are shorted or connected in parallel. The maximum output voltage is between 85% and 95% of the total charging voltage, depending on the load and the waveform. Details about the load range and output voltages are given in our offers/quotes.

COMPONENTS OF THE IMPULSE TEST SYSTEM
The test system comprises the following main components:
- Impulse Generator stack
- Charging Rectifier
- Impulse Voltage Divider
- Control System
- Measuring System

ACCESSORIES
- Air cushion system
- Top electrodes
- Shunts
- Termination resistors
- Chopping Gaps
- Additional circuits for transformer testing
- Additional circuits for Impulse Current generation
- External series overshoot circuit
- Matching and isolating transformers
- Weather proof enclosures

IMPULSE GENERATOR STACK
Support frame
Fiberglass reinforced supporting columns make the design very stable.

Each stage of the impulse voltage generator is equipped with one 100 kV impulse capacitor, one tail, one front and one potential resistor, as well as with the elements of the spark gap. The spark gap distance is adjusted by a mobile additional fiberglass column which is moved linearly in function of the pre-selected charging voltage. The stages have been designed for a very low inductance.

Impulse capacitors
Each impulse capacitor consists of flat elements built into a steel housing and impregnated with castor oil. The housing walls are flexible so that the impregnating oil can expand. Two 100 kV impulse capacitors are positioned in a V-arrangement in each stage. Castor oil insulation offers optimal ecological safety (no PCB’s).

Resistors
They are the wave shaping elements and wire-wound for high stability and linearity and are wound on tubes and protected by shrink wrap.

Each resistor value has a specific colour for easy identification. These resistors have a plug-in connection for quick and easy reconfiguration. The basic system includes a set of resistors for lightning impulse voltages according to IEC 60060-1.

Connection rods with multiple slip-in sockets are mounted and can hold up to 4 resistors.

Combination of Multiple series- and parallel connections of resistors are possible to obtain additional values.
Encapsulated spark gaps
The enclosure protects the spark from dust and dirt. It also damps impulse noise and protects the close environment and the operating personnel of the impulse generator from light flashes and ultra-violet radiation.

CHARGING RECTIFIER LGR 100
The charging rectifier type LGR 100 is used to charge the impulse capacitors with stage voltages up to 100 kV and is located on its own wheeled base frame.

- Compact & rugged design.
- Short circuit protected.
- Automatic motor-driven polarity reversal
- Current - 20mA

DAMPED CAPACITIVE VOLTAGE DIVIDERS
More details in individual catalog of CS

- CS

CONTROLS
Two systems differing in sophistication and technical specification are available. Please refer to individual Control System’s catalogues

- Competitive and well established GC 223
  - Standalone desk top unit
  - EMC shielded and proof tested

- Fully computerised GC 257- operating under Windows.
  - Sophisticated sequence programs
  - User-friendly software equipped with a flat screen colour monitor

Safety and Protection Functions
The control unit has a connection for a safety circuit and is equipped with a connection for warning lights.

IMPULSE ANALYSING SYSTEMS

- HIAS® 744
  - A multi-channel capable precision digital impulse analyzing system of the highest performance class.
  - 11 / 16 bit real vertical resolution at 250 MS/s
  - Automatic evaluation of all common impulse shapes and their parameters
  - Fiber Optic Communication to control room with galvanic separation

Please refer individual catalogue of HIAS 744
OPTIONS

Shunts
Haefely shunts can be used for the measurement of impulse currents. They consist of a metal cylinder with coupling flanges and coaxial measuring connector. Different models are available depending on the application.

Chopping Gaps
- KFS Series
  - Simple Straightforward Sphere Gaps useful for measurement, calibration as well as chopping.
  - Available in Vertical-Motorized and Horizontal-Manual versions
  - Voltage rating ranges from 150kV to 750 kV
- MAFS Series
  - Original and Patented by Haefely
  - Used for front and tail chopping
  - Voltage rating ranges from 600 kV to 3600 kV

Please refer individual catalogues for more details.

Overshoot Compensation
An overshoot compensation circuit (OC) can be used to test very high capacitive loads according to the standard impulse shapes. The overshoot compensation is connected on the top of the Impulse Divider.

Impulse Voltage Generator with HAEFELY patented overshoot compensation (equivalent single stage circuit)

Glaninger Circuit.
For testing low voltage windings of transformers, an additional circuit is available as an option. This external circuit permits the testing of very low inductive loads.

The Glaninger circuit presupposes the existence of the tail resistor set SGS RP.

Impulse Current generation
Only additional resistors and wave shaping inductances are necessary for generating impulse currents up to 20 kA with an impulse voltage generator. Exponential impulse currents acc. IEC 60099-4 can be generated on test objects having very high residual voltages.

Impulse current testing arrangement with SSG ZUB
TECHNICAL SERVICES
A high level of customer service is essential in view of the
complexity of high voltage test systems and the high
reliability demanded by the customer.

The full warranty of the impulse voltage test system is
conditional on the performance of the following Haefely
services:
- Expert installation and on-site testing of the system
- Training of the operating personnel
- Maintenance of the test system throughout its service
  life, but for a period of at least 10 years (other than
  computers)
- Availability of spare parts

TRAINING OF OPERATING PERSONNEL
After acceptance testing, the client’s personnel assigned to
operate the impulse voltage test system will be trained.
Installation and operator training is conducted by our
customer-service personnel and will be adapted to suit the
particular test facility and test specimen. This is an
important contribution to reliable operation of the test
system.

10 YEARS MAINTENANCE GUARANTEE
Because of the high degree of vertical integration with
respect to high-voltage components and electronic
equipment, Haefely is virtually independent of the product
policies of suppliers. A large stock of replacement parts is
held for maintenance purposes. This makes it possible for
Haefely to ensure the maintenance for 10 years (other than
computers)

OTHER SERVICE OPTIONS
ON-SITE CALIBRATION SERVICE
Simple and unified calibration methods which apply to
complete measuring systems give high-voltage test
equipment manufacturers, users and customers the
assurance of comparable quality requirements and tests
involving such equipment.

Haefely Test performs following services on-site or in our
works:
- Calibration of divider
- Calibration of measuring device
- Calibration of entire system

MAINTENANCE AGREEMENT
Haefely Test offers a maintenance agreement tailored to
the customer’s special needs. In this way, the value of the
test system can be preserved over a long period of time.

Further services are offered for support in integration tasks
or during operation
